The experience of pain is a national public health problem with physical, emotional, and societal costs.

50 MILLION ADULTS live with daily chronic pain.

19.6 MILLION ADULTS experience high-impact chronic pain that interferes with daily life or work activities.

THE COST to our nation is between $560 to $635 billion a year.

BACKGROUND

- Personalized and patient-centered care by clinicians;
- Multidisciplinary approaches using one or more treatment modalities that consider the biological, psychological, and socio-environmental factors of pain, as well as the various comorbid conditions can accompany complex pain conditions; and
- Special patient populations, such as youth/pediatrics, older adults, patients with cancer-related pain and patients in palliative care, women, pregnant women, patients with chronic relapsing pain conditions or sickle cell disease, African-Americans, Hispanics/Latinos, American Indians, Alaskan Natives, military active duty, reserve service members, and Veterans.

THE TASK FORCE’S RECOMMENDATIONS SPAN FIVE BROAD TREATMENT APPROACHES TO PAIN MANAGEMENT.
These five treatment approaches are reinforced by four cross-cutting themes critical to all treatment approaches.

The Report also reviews the 2016 Guideline for Prescribing Opioids for Chronic Pain released by the Centers for Disease Control and Prevention. Effective pain management means that people can get back to work, support their families and be active in their communities more quickly.
BEST PRACTICES AND CURRENT REALITIES IN PAIN MANAGEMENT

- Adequate acute and chronic pain care requires an individualized, patient-centered, multidisciplinary approach using one or more treatment modalities. This approach leads to improved clinical outcomes, correct use of pain medication, and reduced risk with prescription opioid use. There is no “one-size-fits-all” approach to treating pain.
- Quicker access to treatment allows for quicker return to work and daily activities resulting in better patient quality of life and lowering the cost of pain to our nation.
- Patients with pain need quicker access to treatment options in order to improve pain management and reduce risk of suicide.

IMPROVING POLICIES TO ADDRESS THE NEEDS OF PATIENTS IN PAIN

The issue of pain management is complicated, and every decision made, law passed, or guideline released has a cascading impact on many aspects of pain management. For that reason, a deep understanding of these issues is key in making effective, comprehensive pain management policy. Below are some of the policy considerations identified by the Task Force.

- Make access to educational tools a priority for the public, patients, families, caregivers, and clinicians in order to remove existing barriers like stigma and improve patient outcomes.
- Reimburse clinicians appropriately for the significant time and resources that are required to care for patients in pain.
- Improve insurance coverage and payment for pain management diagnostic and treatment types to improve access to care for patients with pain, special populations, and patients in underserved areas.
- Expand and incentivize the training and availability of pain specialists.
- Explore solutions to key challenges presented by recurring shortages of opioid and non-opioid pain medications.
- Support research to advance new and effective diagnostic, preventive, and therapeutic approaches for patients living with pain.

ACT NOW
